

Voice & Data Connectivity

As businesses move core functions to the cloud, resilient network structure with business continuity options become essential for the smooth operation of the business. This is particularly important for Voice; a little delay or jitter is not critical for e-mail, for voice it can be crucial.

Our comprehensive range of business class data connections solutions provide many options to meet businesses needs for speed, resilience and budget, and can meet the needs of single-site, multi-site, corporates, SMEs, large corporations and the public sector.

All our connections are business grade and transit business focus network backbone, ensuring that the circuits operate at the optimum speeds.

Ideally, Voice and Data should be on different circuits, this has been proven with over 10 years of supplying voice over data circuits using SIP. The circuits can be on different networks providing an element of Business Continuity.

Our data circuits, used for voice and data, are provided by carefully selected networks that are stable businesses, provide good quality support and detailed technical analysis for when unexpected situations occur.

Network analytics are available for monitoring and problem solving.

For additional resilience and business continuity, voice connectivity can be delivered with two connections from different networks, into a managed route. We have commercially attractive packages for SIP Trunks and DDIs that provide Business Continuity planning at a commercial cost.

Key Benefits

- Choice of Technologies
- Stable Networks
- Business Grade Networks
- Business Continuity Planning
- Choice of Contract Term
- Managed Circuits
- Managed Routers
- Analytics
